PART 1

Fundamentals

Three lessons on pastry types, blind baking, and correctly thickening a fruit filling.

Pastry Types: Pie Dough, Tart Dough, and When to Use Each

Classic pie dough (pâte brisée) is flaky, made with cold fat cut into flour so distinct layers of butter remain, which puff into flakes as they bake. It's best for double-crust fruit pies and anything that needs a sturdy, rustic crust.

Tart dough (pâte sucrée) is sweeter and more like a cookie — the butter and sugar are creamed together rather than cut in cold, giving a tender, sandy, crisp shell that holds its shape well for a free-standing tart.

A graham cracker or cookie crumb crust is the simplest option, pressed rather than rolled, and is used throughout this book for no-bake and chilled fillings where a classic pastry crust isn't needed.

- Flaky pie dough: cold butter kept in visible pieces, for rustic double-crust pies
- Tart dough: creamed butter and sugar, for a crisp, cookie-like shell
- Crumb crust: pressed, not rolled, best under no-bake or chilled fillings
- Keep all pastry doughs cold until the moment they go in the oven

Blind Baking and Preventing a Soggy Bottom

Blind baking means baking a crust partially or fully before adding a wet filling, so the bottom sets and crisps rather than steaming under the filling. Line the raised, chilled crust with parchment and fill with pie weights or dried beans to hold its shape.

Bake until the edges are set and lightly golden, then remove the weights and parchment and continue baking the base alone until it's pale gold all over, for a fully baked crust, or just set, for a partially baked one meant to finish baking with its filling.

For custard or cream fillings that only need a short additional bake, fully blind-bake the crust first. For a filling that bakes a long time anyway, like a fruit pie, partial blind-baking is usually enough.

- Blind bake = bake the crust (weighted) before adding a wet filling
- Pie weights or dried beans hold the crust's shape while it sets
- Fully blind-bake for short-bake fillings like custard
- Partially blind-bake when the filling itself bakes a long time

Thickening Fruit Fillings Correctly

Fruit releases a lot of liquid as it bakes, and under-thickened filling means a runny, soupy pie that won't hold a slice. Cornstarch, flour, and tapioca are the three thickeners used in this book, and they aren't interchangeable in quantity — cornstarch thickens more strongly per tablespoon than flour.

Juicier fruits (berries, cherries, peaches) need more thickener than firmer ones (apples, pears). Taste the raw filling for sweetness before baking — you can't easily adjust sugar once it's baked, but you can always add a touch more if it tastes flat.

Let a fruit pie cool completely, usually several hours, before cutting. The filling is still setting as it cools, and cutting too early gives a filling that runs out rather than holding its shape.

- Cornstarch, flour, and tapioca thicken differently — follow each recipe's exact amount
- Juicier fruit needs more thickener than firmer fruit
- Taste the filling for sweetness before baking, not after
- Cool fruit pies completely (several hours) before cutting for clean slices
